

Short description: PhoneBoard Project will be a mobile application whose purpose is to take short sound recordings(10s max) and assign them to one of the 6 different buttons available. If a recording is assigned on a button who already had an existing recording on it, then the new recording will take its place. This application started as the theme for our *Mobile systems and applications* laboratory hours project.

App Title: At the top of the screen will be displayed the app title, “PhoneBoard Project”.

Button: the app has 6 similar looking buttons. At first the buttons don’t do anything if pressed. After a sound is recorded and then assigned to one of the buttons, then by pressing the specific button the recording will play.

Record Button: a round button, bigger than the rest and situated in the middle of the screen, below the 6 other buttons. Once pressed it will start sound recording for 10 seconds. After that you will have the option to press one of the 6 buttons above, in order to assign the recorded sound to one of them.

Developer names: in the lower right corner the names of the developers are to be displayed.
